SACC 2016 第八届中国系统架构师大会

SequeMedia Tota ChinaUnix

Outline

- Performance Basics and Methodology
 Fundamentals of Performance Tuning
 - Profiling Driven Optimization
 - JVM Tuning
 - GC
 - JIT
- 3. Optimization Strategy for JavaEE
- 4. Recap

Recall Little's law

$L = \lambda^* W$

In queueing theory, the long-term average number of customers in a stable system, L, is equal to the long-term average arrival rate, λ , multiplied by the average time a customer spends in the system, W

SequeMedia ChinaUnix

SACC 2016 第八届中国系统架构

TPUB

Throughput and RT

MeanNumberInSystem = MeanThroughput* MeanResponseTime

- Throughput and RT are related
 - ✓ Decreasing RT "almost always" improves Throughput
 - Throughput improving doesn't necessarily mean RT decreasing
- Performance tuning and cost saving
 - More higher throughput/lower RT but without adding new hardware

source: https://en.wikipedia.org/wiki/Little%27s_law

TOUB

Approaches to Performance

Approaches:

- a) Outside in approach(performance baseline)
- b) Layered approach("Bottom up" or "Top down")
- c) A hybrid of both a), b)

Amdahl's Scaling Law

F: is fraction of work
that is serial
N: is number of
threads

SACC 2016 第八届中国系统架构师大会

source: https://en.wikipedia.org/wiki/Amdahl%27s_law

TPUB

Reduce the amount of serial work performed

SequeMedia Tras. O ChinaUnix

Costs Reduce Scaling

- 1. Potential contributors to F:
 - Synchronization(synchronized&j.u.c.Lock)
 - data structures need to be thread safe
 - communication overhead between threads

SequeMedia Tiss. () ChinaUnix

- Infamous "stop the world" (aka STW) in JVM
- 2. Cost incurred when the N gets increased
 - Thread context switch

SACC 2016 第八届中国系统架构师

- JConsole (MXBean)
- Java Mission Control
- JProfiler

TOUB

HealthCenter&jucProfiler

Profiling: Sampling vs Instrument

TPUB

Available Technology: BCI, JVMTi, javax.management, System.currentTimeMillis()

SACC 2016 第八届中国系统架构师大会 Seque Media ① ChinaUnix

Sampling vs Instrument

TOUB

Sampling

- ✓ Lower overhead (determined by sampling interval)
- ✓ Discover unknown code
- ✓ Non intrusive
- No execution path
- ✓ Periodicity Bias
- Instrument
 - ✓ Wall time (estimate IO time)
 - ✓ Full execution path
 - $\checkmark\,$ Configuration on what methods to instrument
 - $\checkmark\,$ Generally more data to be collected

Safepoint Bias

- Stack trace sampling happens only when the given thread at a safepoint
 - ✓ The hot loop may not get profiled anymore

UB

- Use following tools instead
 - ✓ Java Mission Control
 - ✓ Honest Profiler(githup)
 - ZProfiler(alipay internal profiling tool)

Tools for Diagnostics

- Most of them could be found in JAVA_HOEM/bin
- Good reference: Troubleshooting Guide for JavaSE 6 with HotSpotVM

Basics of JVM Tuning

TPUB

SACC 2016 第八届中国系统架构师大会 SequeMedia ① ChinaUnix

Guild for GC Tuning

- Select the right GC algorithm
 - parallel old ,CMS and G1 collector
 - Rule of thumb: GC overhead is ideally < 10%
- Choose the right heap size

Space	Command Line Option	Occupancy Factor	
Java heap	-Xms and -Xmx	x 3x to 4x old generation space occupan after full garbage collection	
Permanent -XX:PermSize 1.2x to 1.5x permonent Generation -XX:MaxPermSize occupancy after f		1.2x to 1.5x permanent generation space occupancy after full garbage collection	
Young Generation	-Xmn	1x to 1.5x c d generation space occupancy after full garbage collection	
Old Generation	Id Generation Implied from overall Java 2x to 3x old generation heap size minus the young after full garbage colle generation size

• Configure the appropriate GG parameters

SACC 2016 第八届中国系统架构师大会

JIT and common optimization

SequeMedia ChinaUnix

- Important concepts
 - Profiler guided optimization(PGO)
 - Optimization decisions are made dynamically
 - Mix mode execution
- Some common optimization
 - Inlining
 - Intrinsic
 - Monomorphic dispatch

Liskov substitution principle Subtypes MUST be substitutable for their base types

Typical distributed JEE architecture

The problem...

- Add communication cost
 - ✓ RPC
 - ✓ serialization/deserialization
- Can not shift resources towards demand
- Can not share the underlying Java artifacts(such as JIT)

TPUB

Multitenancy for JavaEE

Run multiple Java EE applications (as tenants) into same Java EE container

SequeMedia Tiss. O ChinaUnix

SACC 2016 第八届中国系统架构师大会

TPUB

High Density Cloud for JavaEE

The JavaEE applications developed separately can be deployed seamlessly into the same container.

- devOps
 - Orchestrate JavaEE application at scale
- Infrastructure
 - 'Multi-tenant' JavaEE container
 - 'Virtualized' JVM

source: https://www.dreamstime.com

Tomcat/JDK extended for PaaS

- AliTomcat: run multiple apps side-by-side safely
- AJDK allows for collocation of multiple JEE apps(as tenant) in a single instance of JVM:
 - **Isolate** application from one another.
 - Share metadata aggressively and transparently, such as:
 - ✓ bytecodes of methods
 - ✓ GC
 - ✓ JIT

AJDK: Alibaba/Alipay JDK, based on OpenJDK

TOUB

SACC 2016 第八届中国系统架构师大会

SequeMedia Triss. O ChinaUnix

AAE: Alibaba Application Engine

- Scaling tenant application with AAE
 - spread application evenly across hosts
 - but pack applications on the single JVM as mush as possible, based on its resource capacity:
 - CPU usage
 - Memory(monitoring GC)

Benefits(Cont.)

- Eliminate the unnecessary RPC
- Minimize the cost caused by object serialization/deserialization
- Share underlying Java artifacts as much as possible
 - GC
 - JIT
 - Heap

Summary

- What we covered:
 - Performance basics& methodology

TOUB

SequeMedia TT68. O ChinaUnix

- Performance tuning
 - Profiling
 - Tuning from JVM perspective
- Multitenancy for JavaEE
