Safe Harbor Statement

The following is intended to outline our general product direction. It is intended for information purposes only, and may not be incorporated into any contract. It is not a commitment to deliver any material, code, or functionality, and should not be relied upon in making purchasing decisions. The development, release, and timing of any features or functionality described for Oracle's products remains at the sole discretion of Oracle.

Program Agenda

- 1 Introduction
- 2 Oracle Storage Roadmap
- 3 Business Challenges Solved
- 4 Conclusion

Storage Experts Session at the RAC booth in Demo Grounds on Wednesday at 2:00pm

A Different Perspective

- Past OOW presentations feature and function focused.
- I/T evolution to Cloud Architecture requires a different perspective.
- Roadmap focus is *past, present, near future, and beyond*.
- Storage Experts Session at the RAC booth in Demo Grounds on Wednesday at 2:00.

Classical ASM/ACFS Architectural Presentation

Database RAC

**Application, Middleware &
General Files**

ASM/ACFS Storage Management

ACFS

ASM

**ASM
Disk
Group**

ASM Files

DB Data Files

OCR & Voting Files

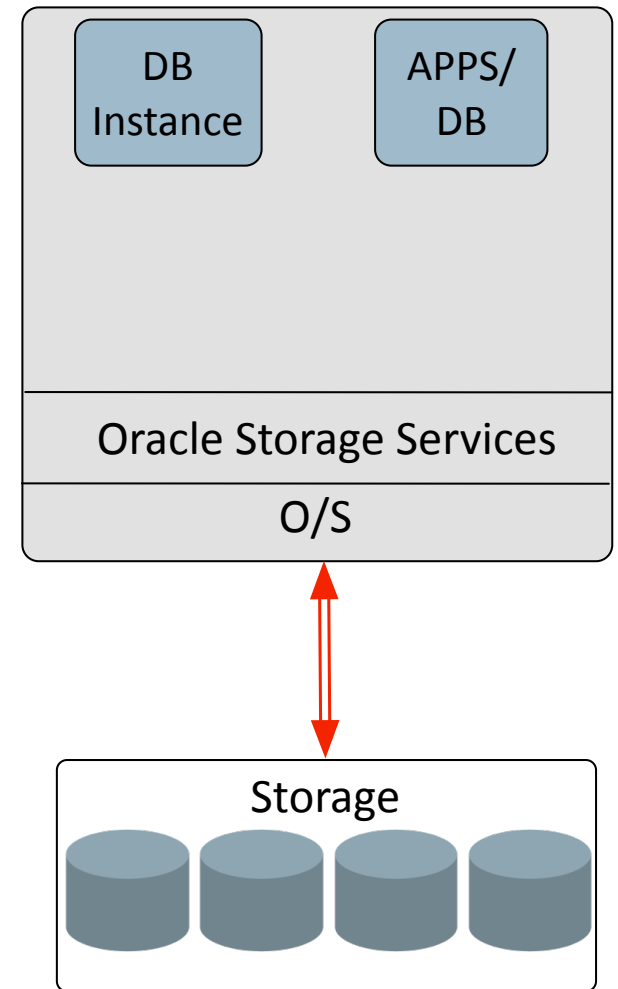

Dynamic Volumes

Oracle ACFS

ORACLE

ASM & ACFS are Oracle Storage Services

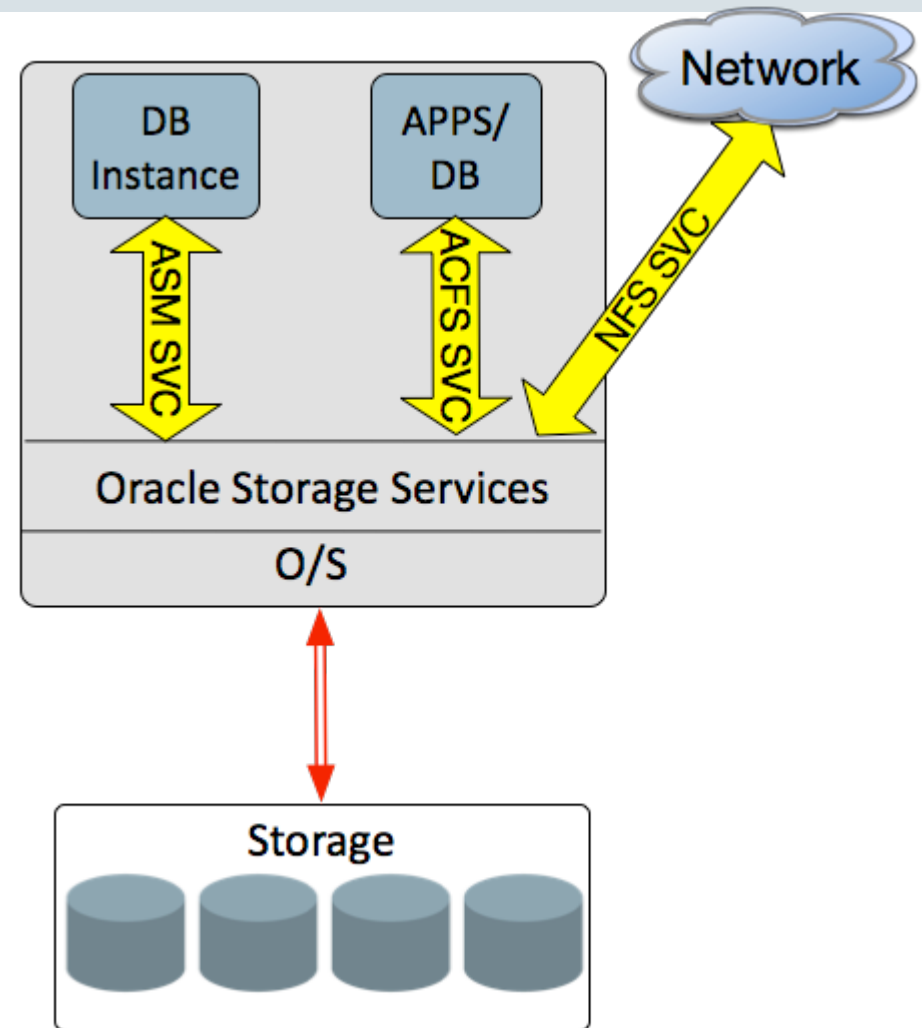

- Another perspective:
 - ASM/ACFS as a platform for storage management – *Oracle Storage Services*.
 - Support applications and databases for standalone servers and clusters.
 - Moving forward, Oracle Storage Services provide foundation for cloud computing.

Examples of Oracle Storage Services

Roadmap of storage architecture models:

- *(Past)* Standalone Cluster Storage
 - Grid Infrastructure Release 11.2
- *(Current)* Cluster Domain Storage
 - Grid Infrastructure Release 12.2
- *(Near Future)* Converged Storage
- *(Beyond)* NUSA Storage

Program Agenda

- 1 Introduction
- 2 Oracle Storage Roadmap
- 3 Business Challenges Solved
- 4 Conclusion

Standalone Cluster Storage Model (Past)

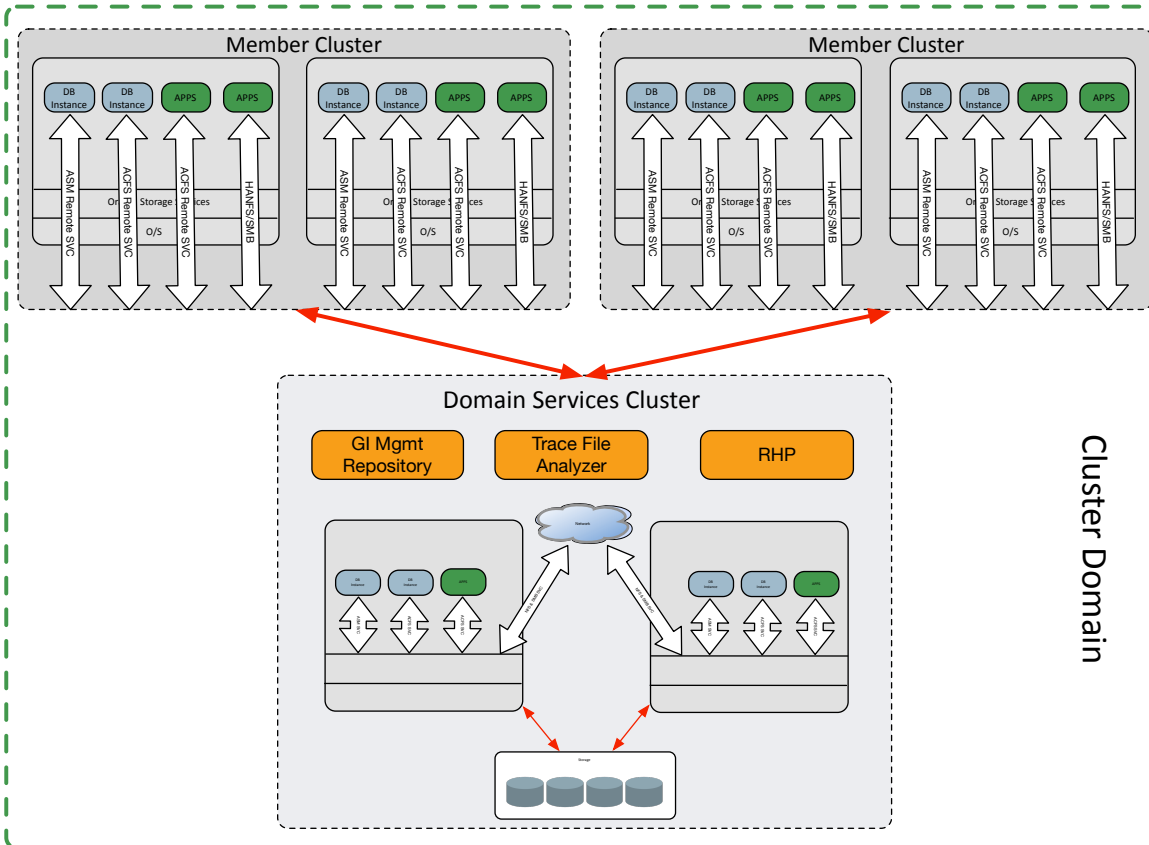

- Standalone clusters.
- All data is physically local to cluster.
- Storage Services
 - ASM Local Service
 - ACFS Local Service
 - NFS/SMB Service
- Based on Grid Infrastructure Release 11.2.

Standalone Cluster Storage Model

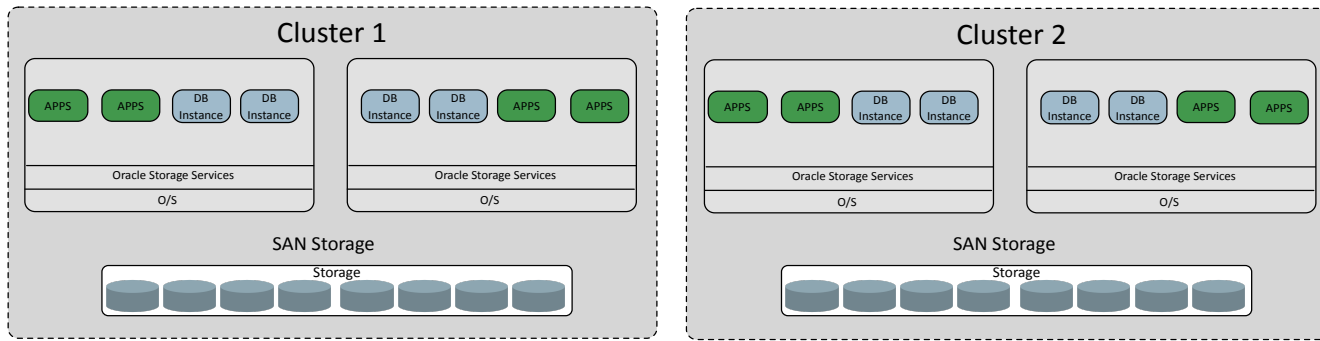

- Independent Name Spaces i.e. Disk Groups and files systems are individually addressed.
- Limited Data Mobility.
 - Manual Disk Group dismount and remount across clusters.

Cluster Domain Storage Model (Current)

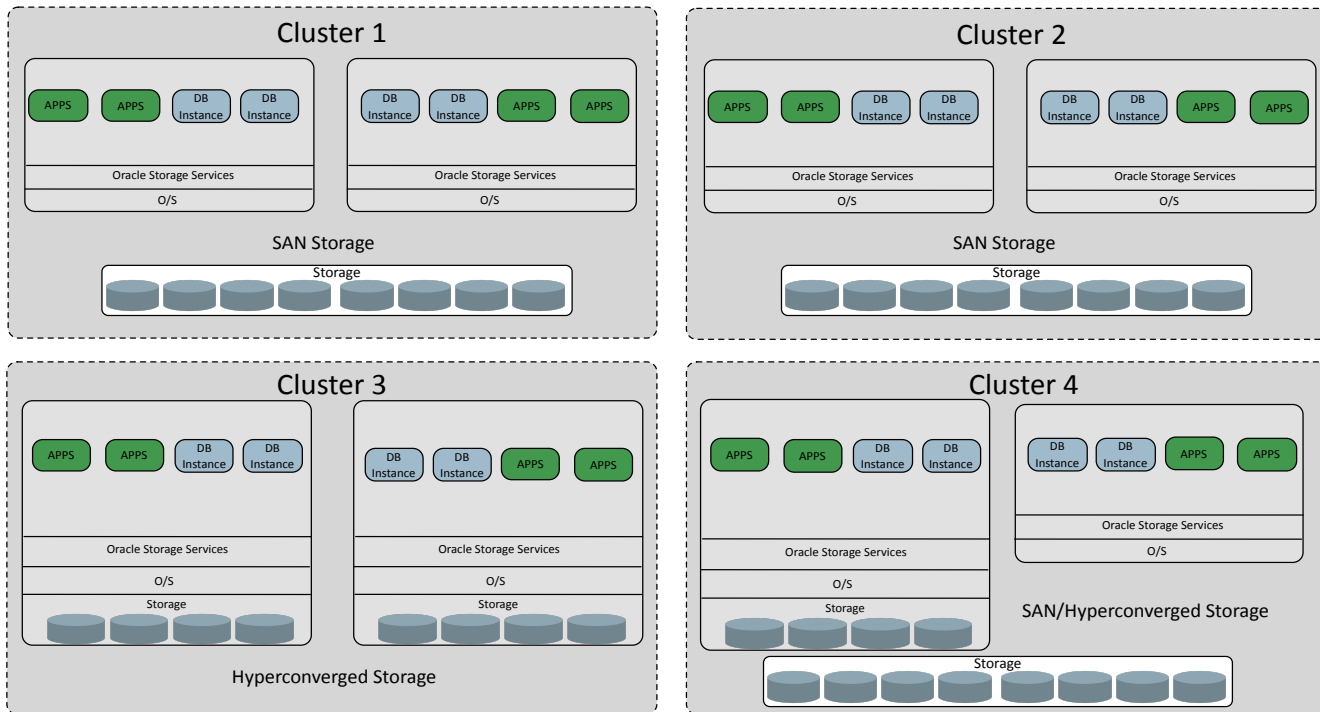

- Single Domain Service Cluster and many Member Clusters.
- One single shared Name Space exposed to Cluster Domain.
 - Member Cluster access via SAN or Network
- New Storage Services include:
 - ASM Remote Service
 - HA-NFS/SMB
- Available in Grid Infrastructure 12.2.

Converged Storage Model (Near Future)

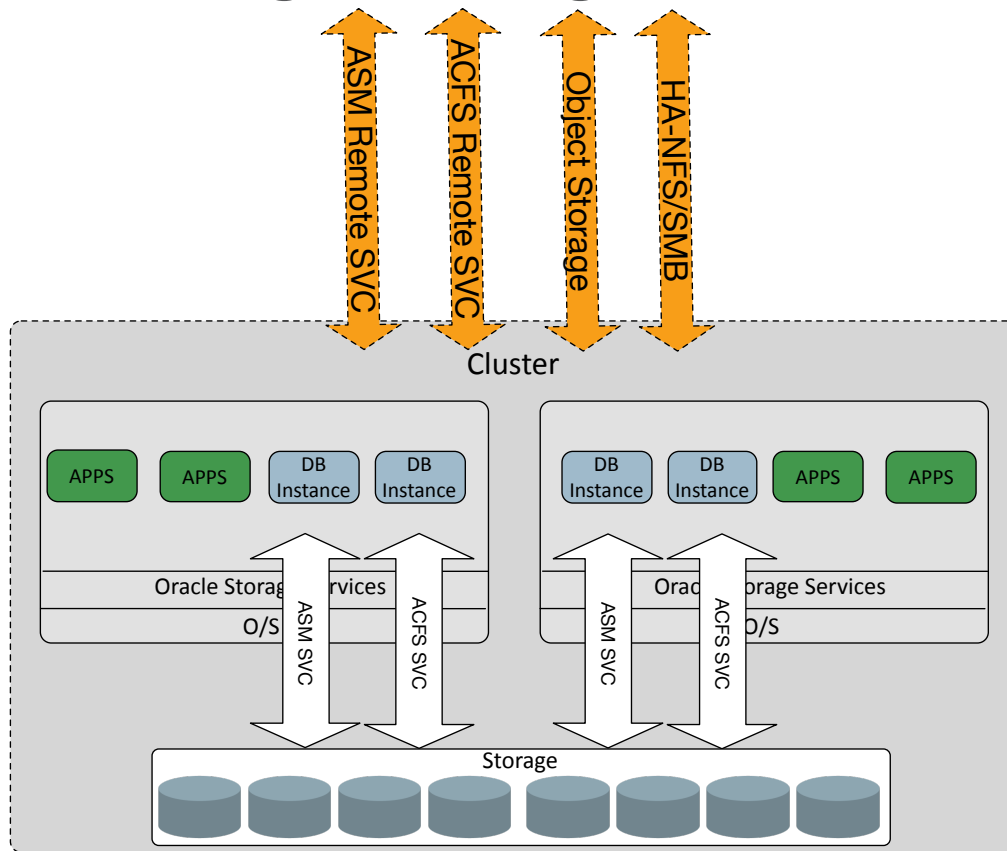

- Collection of tightly integrated servers.
- Supports either SAN

Converged Storage Model

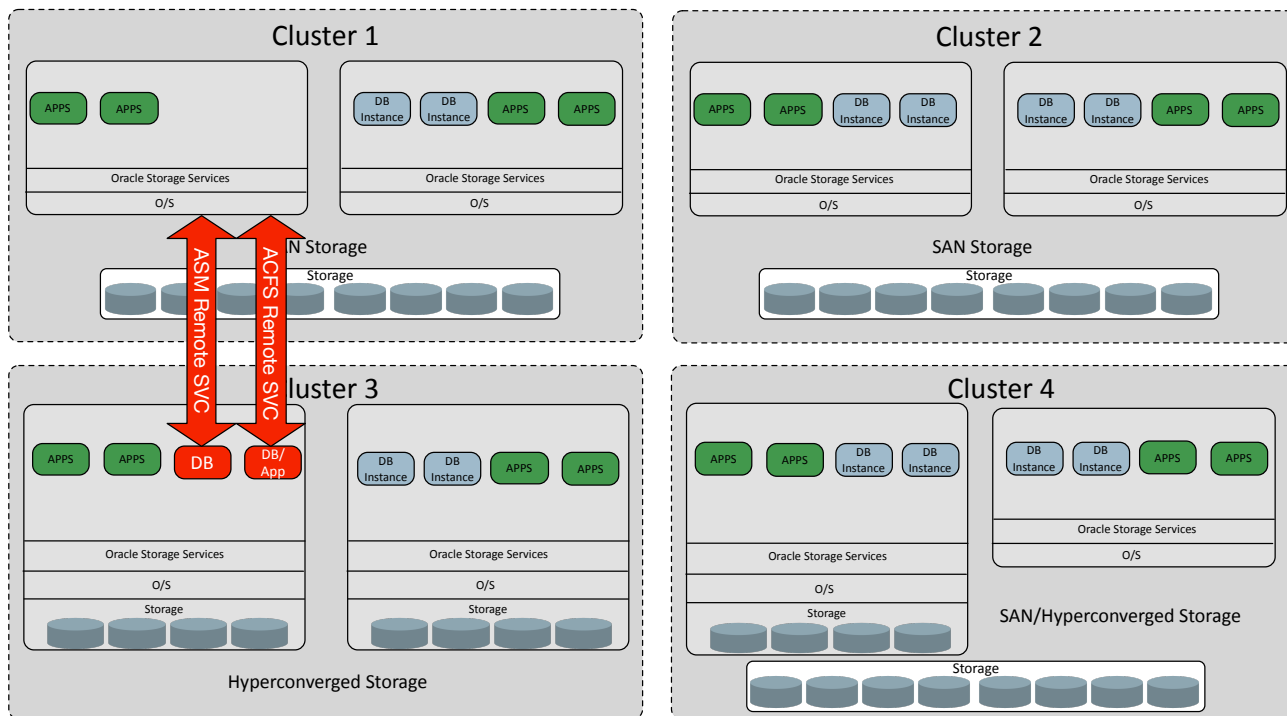

- Supports either SAN or hyper-converged storage. (Clouds)
- Independent Name Spaces.

Converged Storage Model

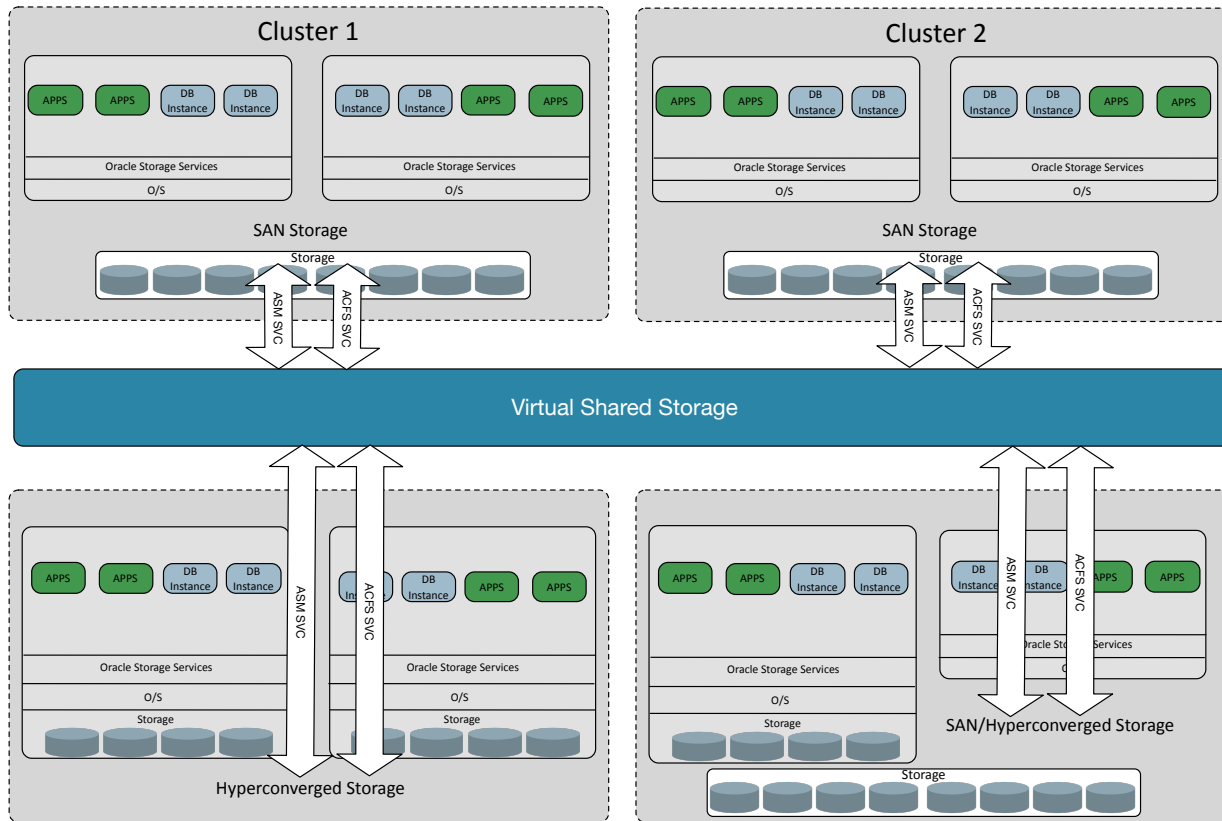

- New set of remote access services introduced.
- Storage Services:
 - ACFS Local
 - ASM Local
 - ACFS Remote
 - ASM Remote*
 - HA-NFS/SMB
 - Object Storage

Converged Storage Model

- Enables database instance and application access to storage in different clusters via network.
- Cloud storage foundation.

Non-Uniform Storage Architecture (NUSA) Model (Beyond)

- Support for SAN-based and hyper-converged storage.
- NUSA virtualizes storage from many clusters into a single common *Name Space*.
- Virtual Shared Storage pool shared by databases and applications.
- Cross-cluster data placement optimized for workload and reliability requirements.
- Cloud foundation+++.

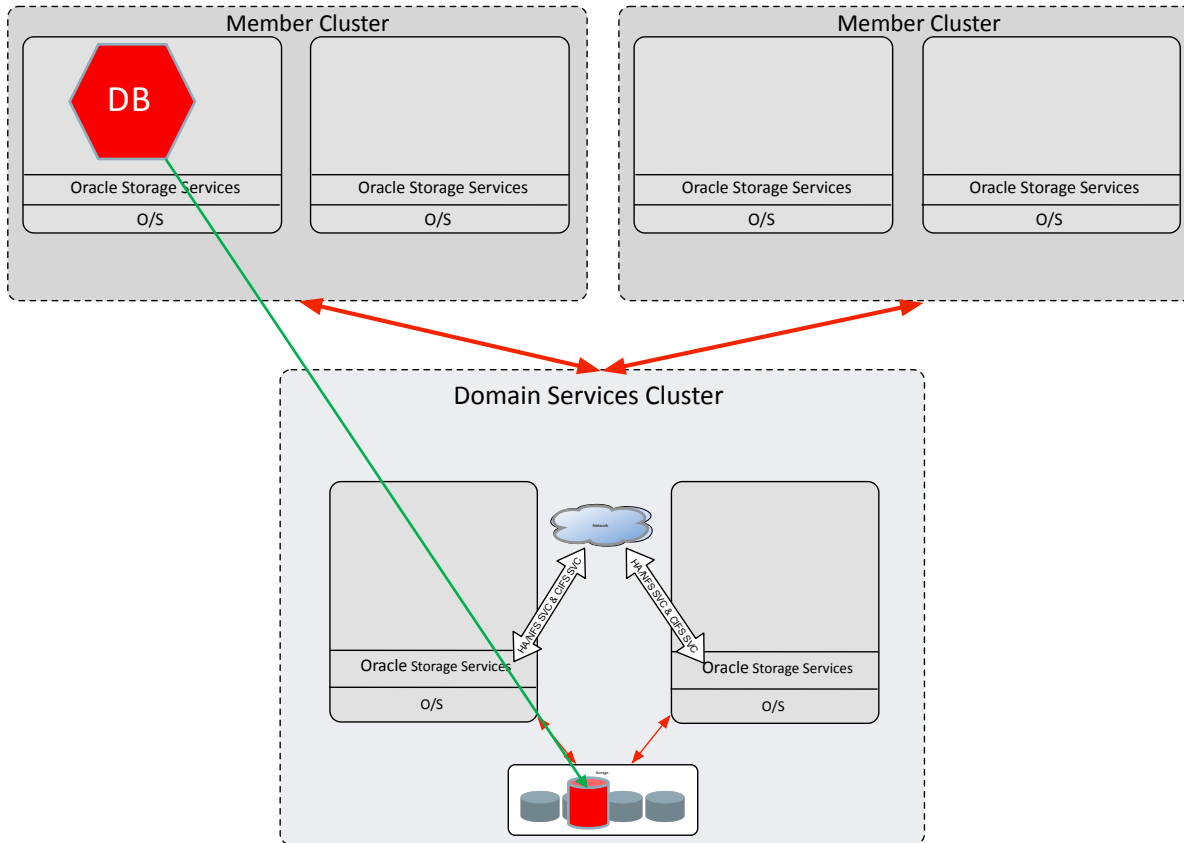

Program Agenda

- 1 Introduction
- 2 Oracle Storage Roadmap
- 3 Business Challenges Solved**
- 4 Conclusion

Business Challenge – Need to relocate Databases and Applications between Servers and Clusters

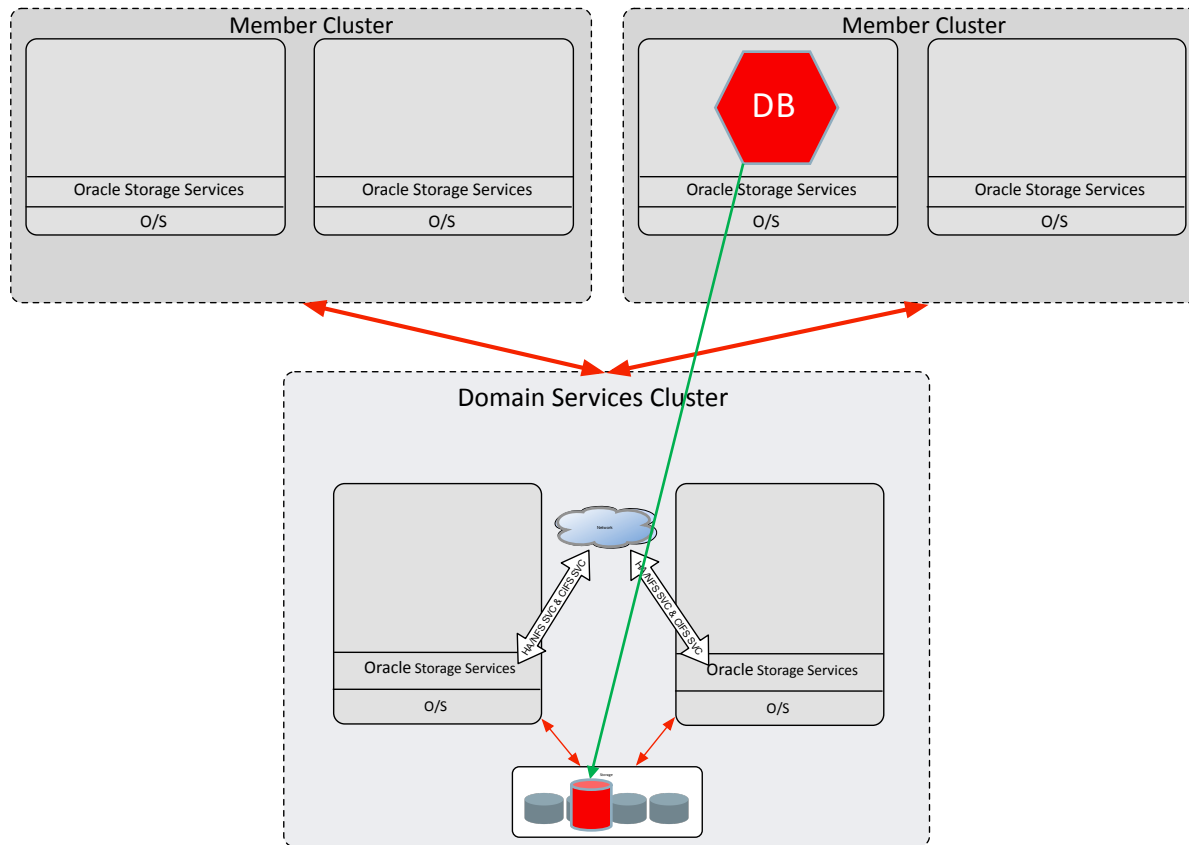

- Workload in one server/cluster is at maximum capacity, but there is available capacity in another server/cluster.
- Need for planned downtime for maintenance may require relocating a database or application workload.

Database on ASM/ACFS relocated within Cluster Domain Storage Model (Current)

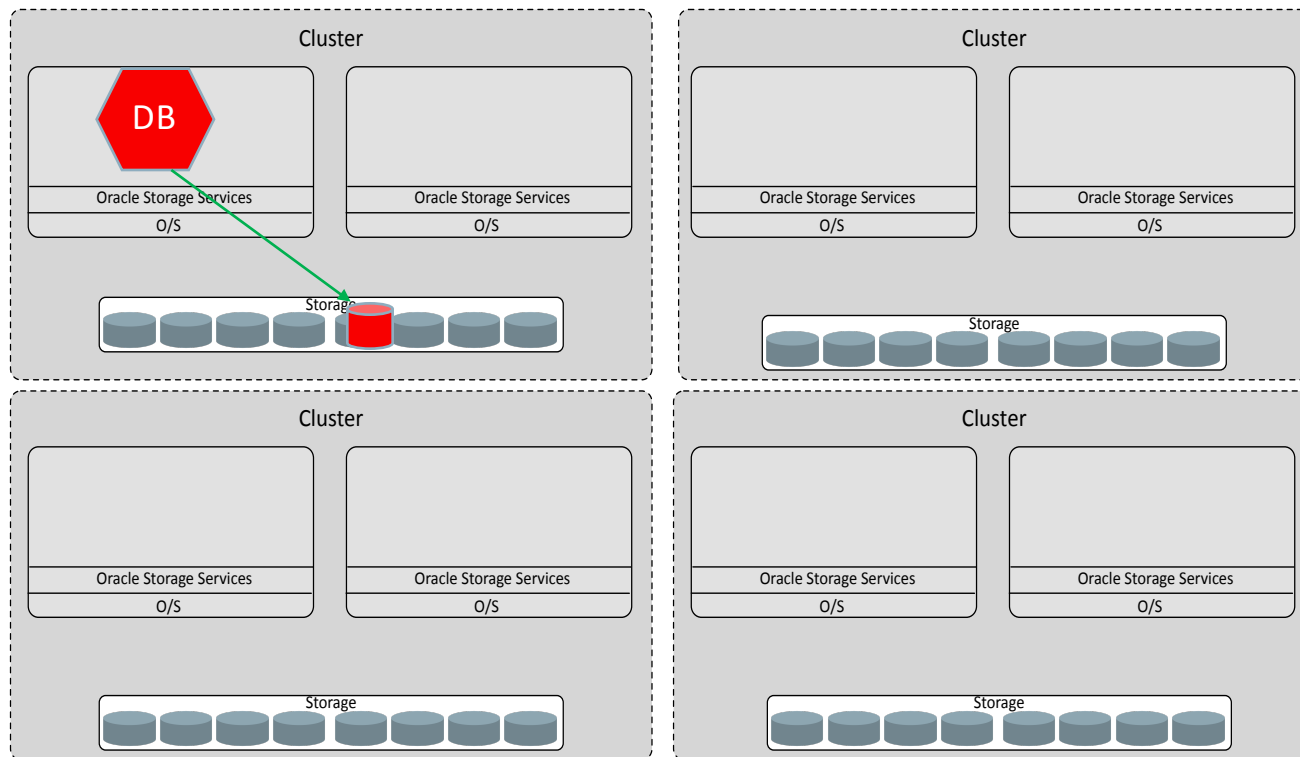

- Database instance running on Member Cluster, but out of capacity.
- Capacity available in another Member Cluster.
- Move database instance from one Member Cluster to another Member Cluster with available capacity.

Database on ASM/ACFS relocated within Cluster Domain Storage Model (Current)

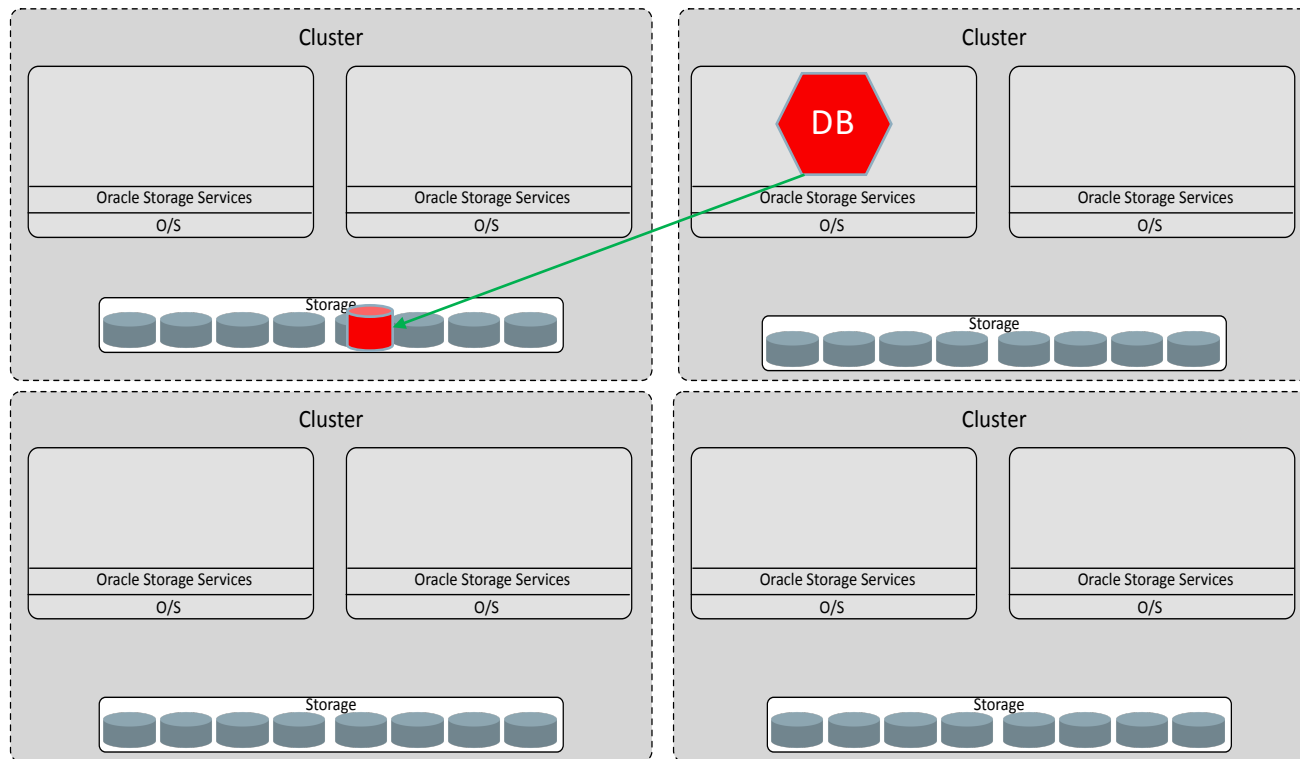

- New database instance in secondary cluster is started.
- Application data can be accessed between Member Clusters as well.
- No impact or downtime to the database.
- Available now in ASM
Coming in Next Generation ACFS

Database on ASM relocated within Converged Storage Model (Near Future)

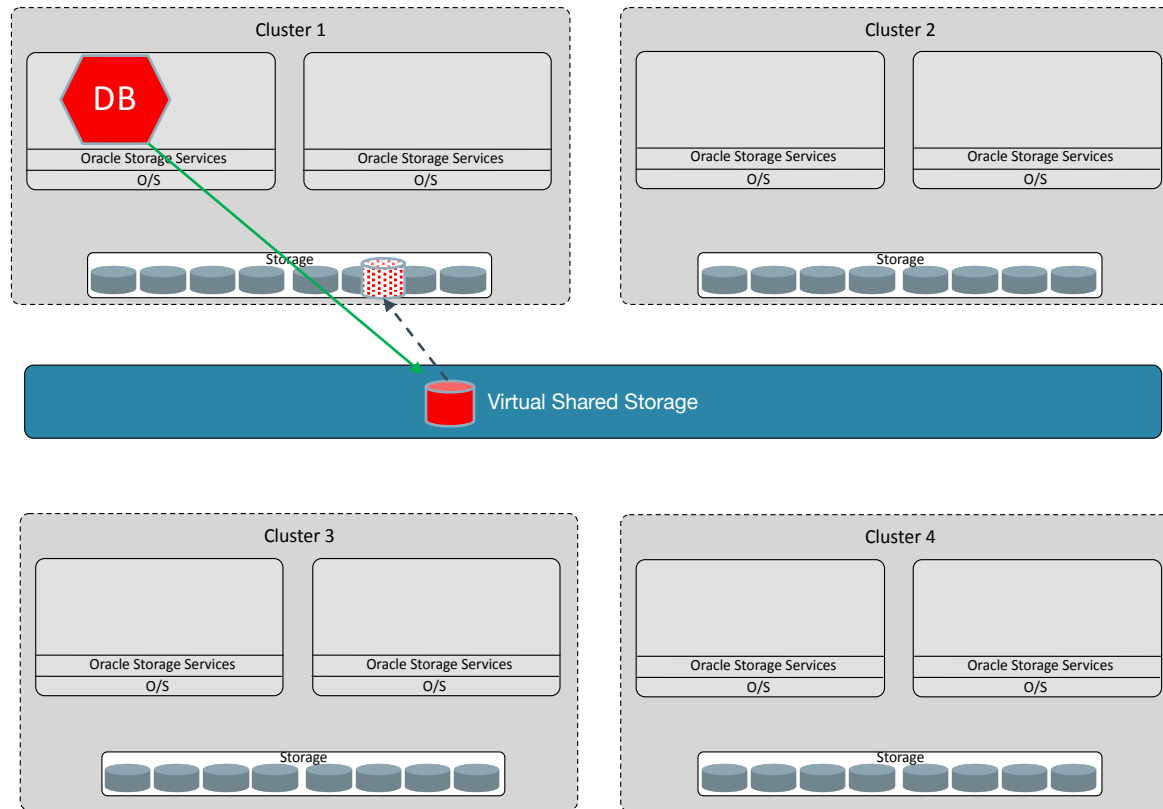

- Initial state of database instance in a Converged Storage Model cluster.

Database on ASM relocated within Converged Storage Model (Near Future)

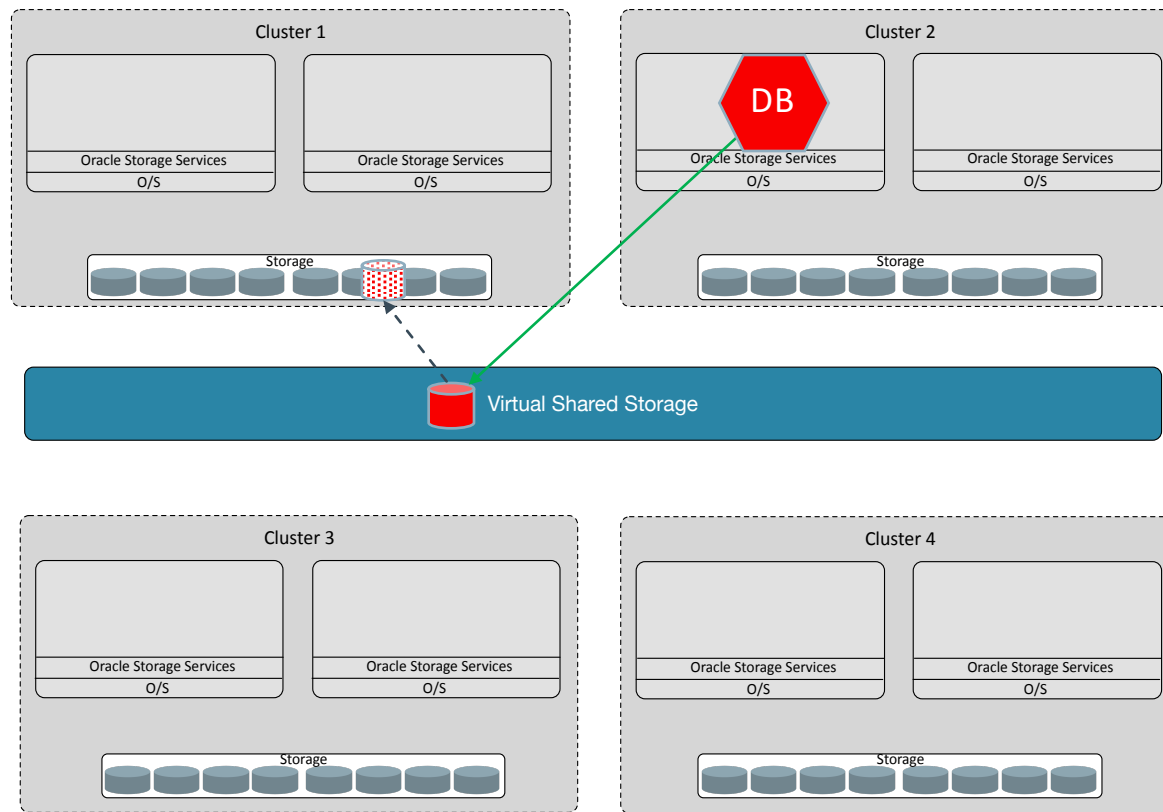

- New database instance in secondary cluster is started.
- Works with Multitenant operations.

Database on ASM relocated within NUSA Storage Model (Beyond)

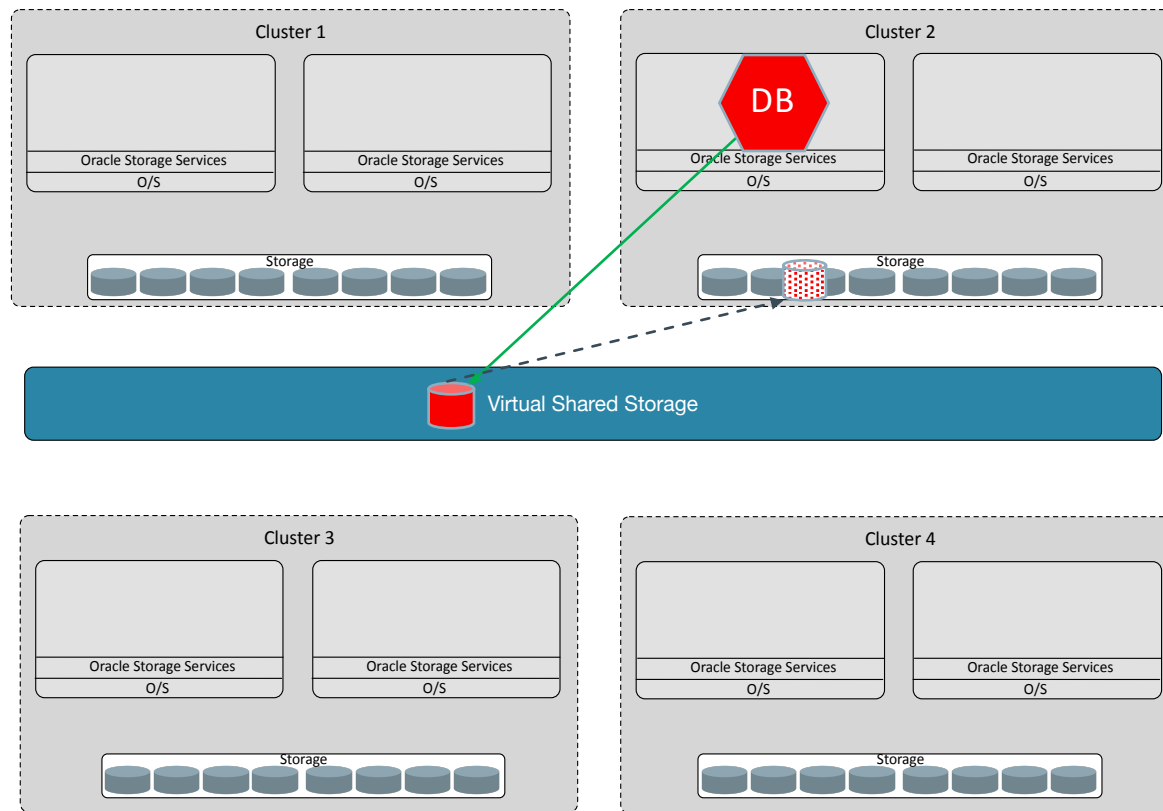

- Database (DB) residing in NUSA storage local to cluster 1.

Database on ASM relocated within NUSA Storage Model (Beyond)

- DB started in secondary cluster.

Database on ASM relocated within NUSA Storage Model (Beyond)

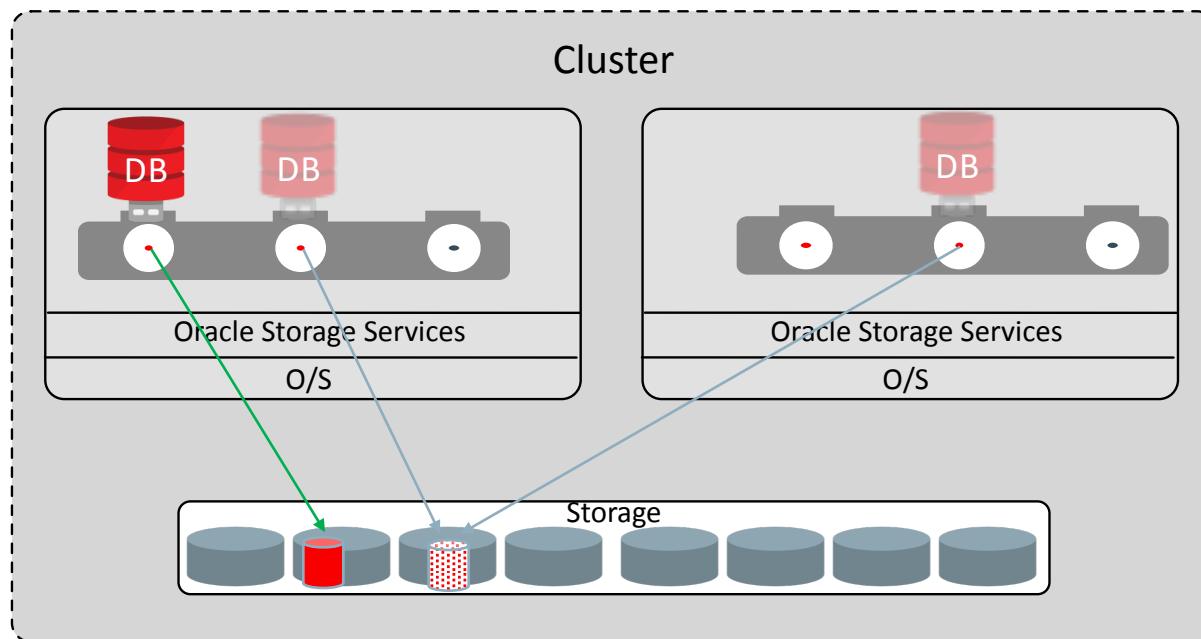

- Under load, data affinity between workload and storage is maintained.
- Data relocation is seamless to the workload.

Business Challenges – Need for Provisioning Database Test and Development Environments

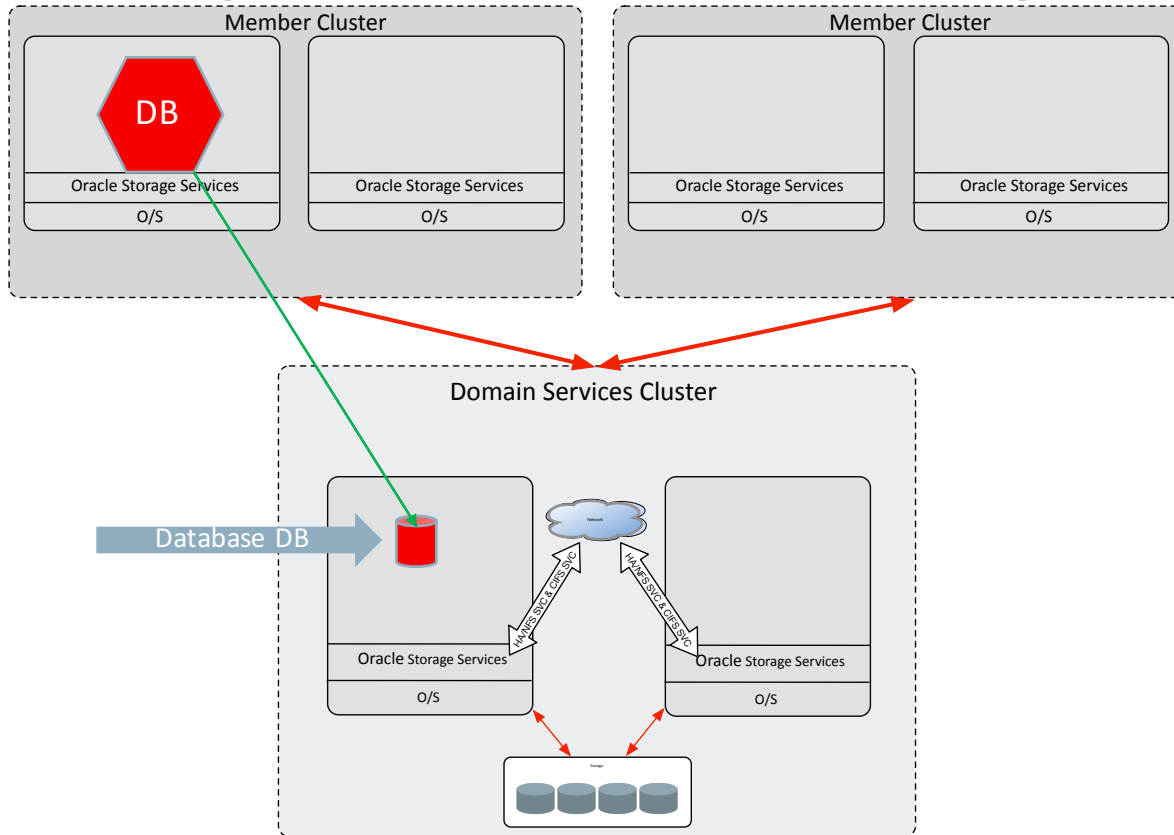

- Environments consisting of databases require point-in-time capture and movement to secondary environments for testing and development (Test/Dev).

Test/Dev Provisioning Across Clusters with ACFS + Multitenant (Current)

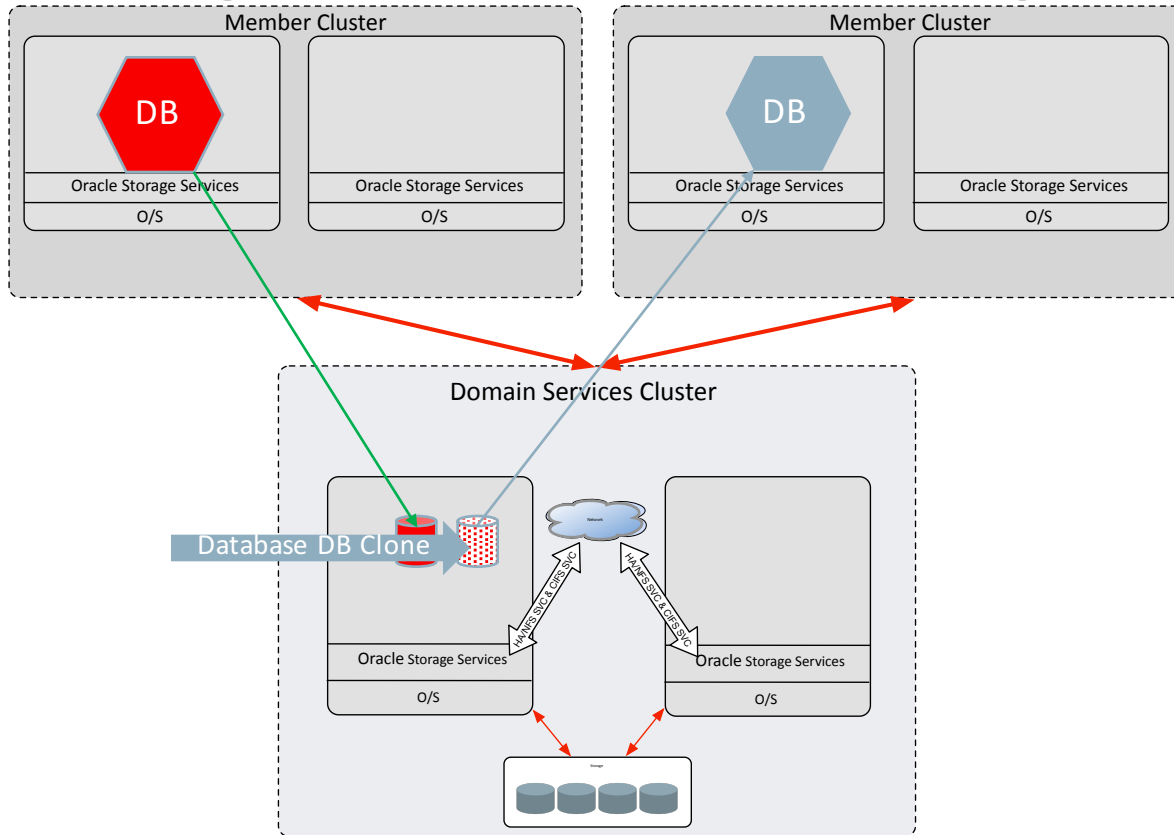

- **Fast & Efficient** sparse clones of PDB's for Test & Dev.
- `SQL> create pluggable database snap_pdb from pdb snapshot copy;`
- PDB Clones are opened in a different node in the cluster making it accessible for Test/Dev purposes.

Test/Dev Provisioning Across Clusters with ASM Database Cloning in Cluster Domain Storage (Near Future)

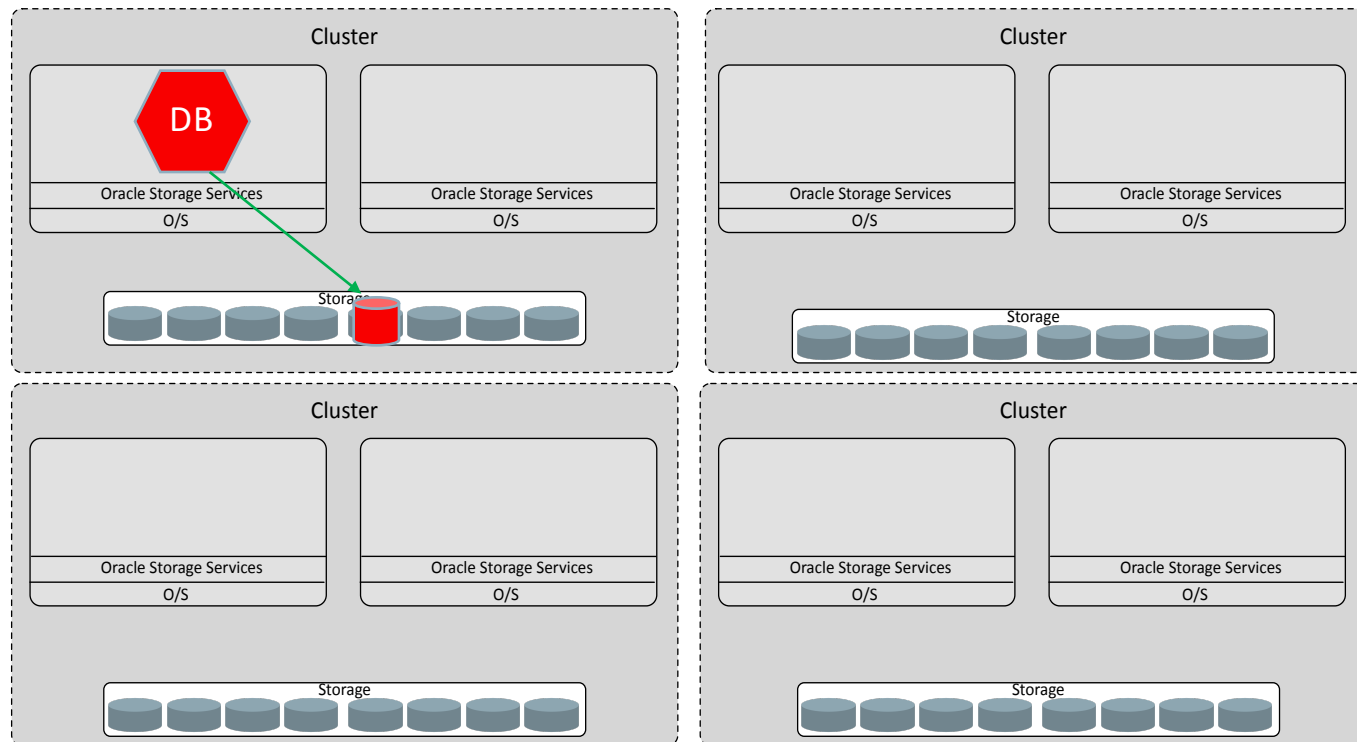

- Initial state of production database.
- Requirement to make a point-in-time copy of database for Test/Dev.

Test/Dev Provisioning Across Clusters with ASM Database Cloning in Cluster Domain Storage (Near Future)

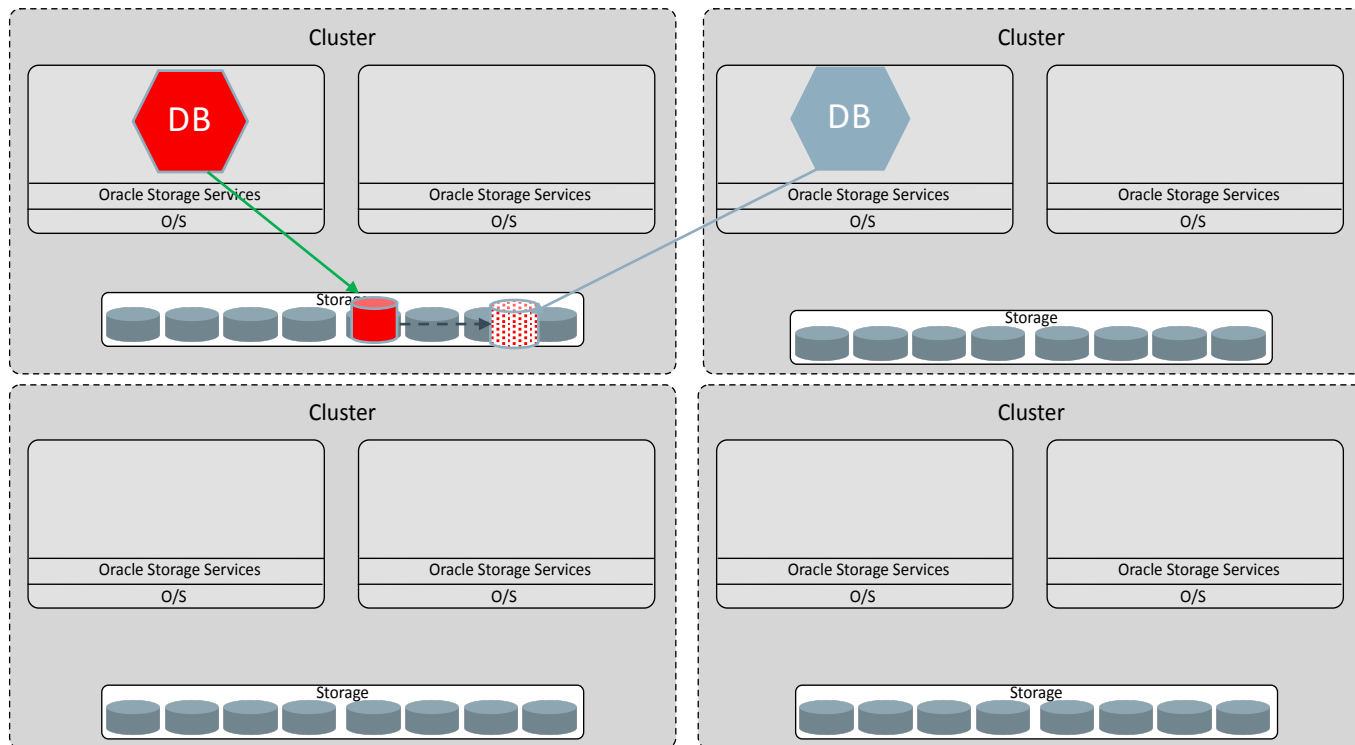

- CDB/PDB DB is cloned from production environment.
- Test/Dev cluster accesses and utilizes new database clone.

Test/Dev Provisioning Across Clusters with ASM Database Cloning with Converged Storage (Near Future)

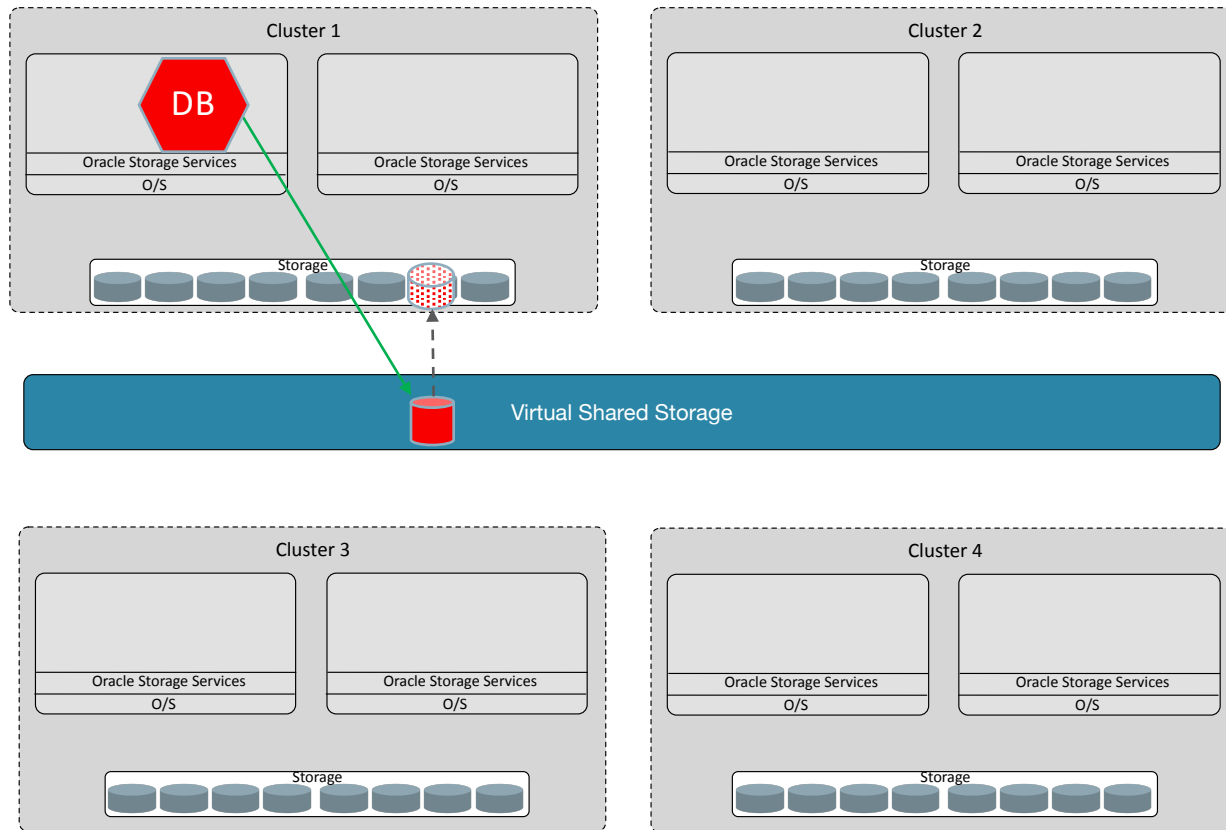

- Initial state of production database in an integrated converged cluster.

Test/Dev Provisioning Across Clusters with ASM Database Cloning with Converged Storage (Near Future)

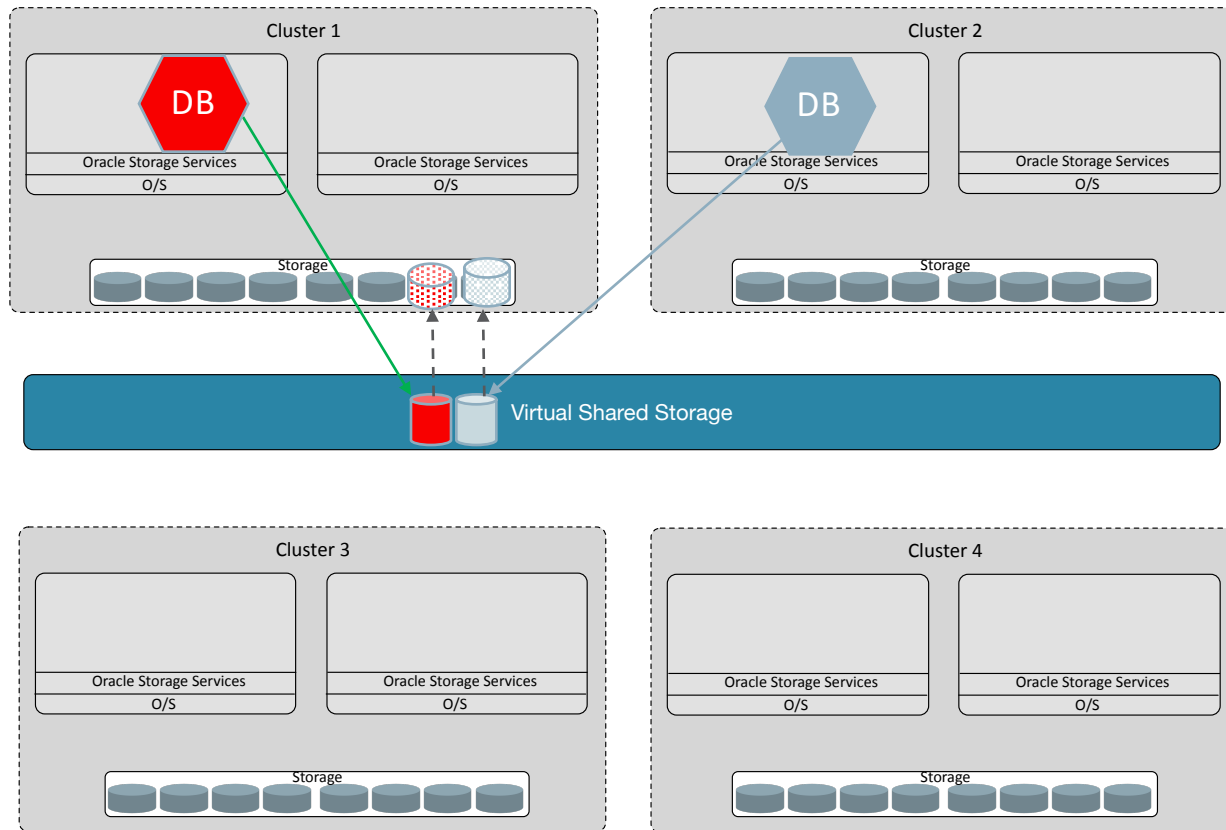

- Database is cloned and accessed from production cluster.

Test/Dev Provisioning Across Clusters with ASM Database Cloning with NUSA Storage (Beyond)

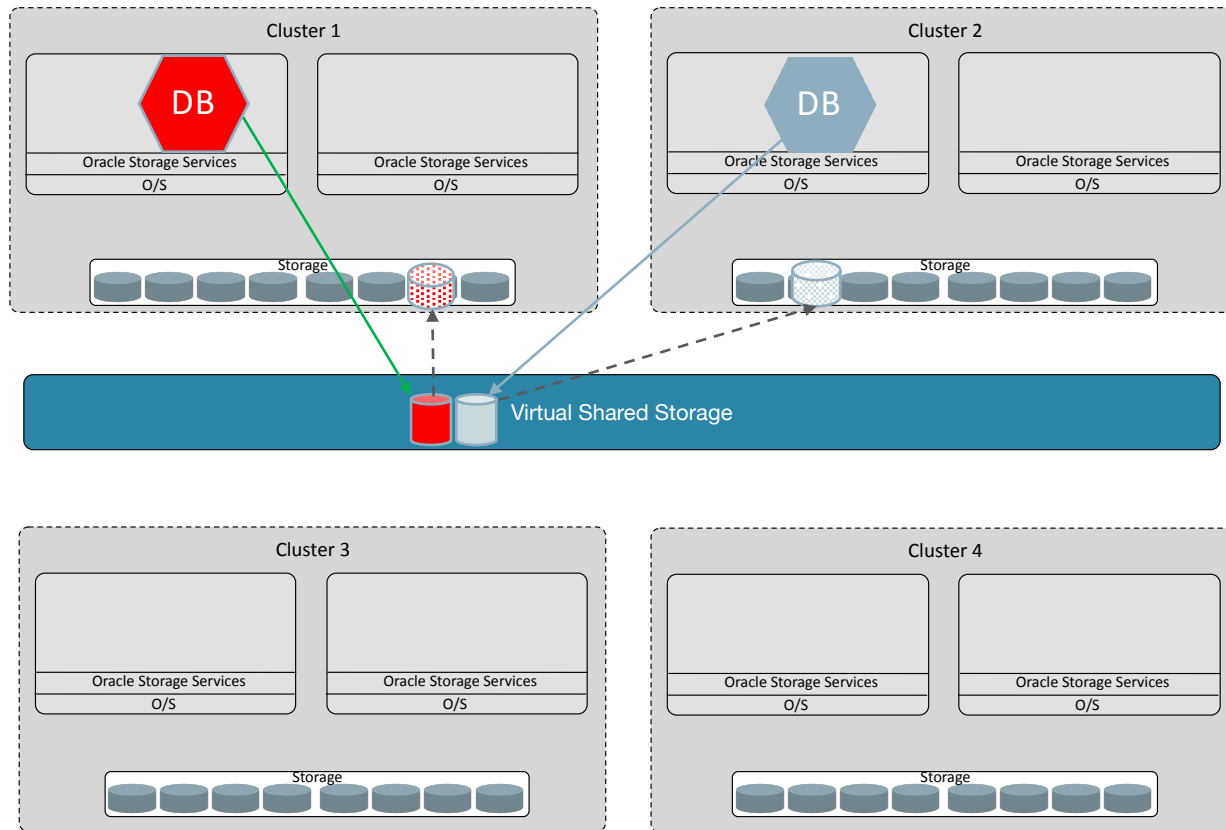

- Production database (DB) residing in NUSA storage local to Cluster 1.

Test/Dev Provisioning Across Clusters with ASM Database Cloning with NUSA Storage (Beyond)

- ASM Database clone created and accessed from Test/Dev cluster 2.

Test/Dev Provisioning Across Clusters with ASM Database Cloning with NUSA Storage (Beyond)

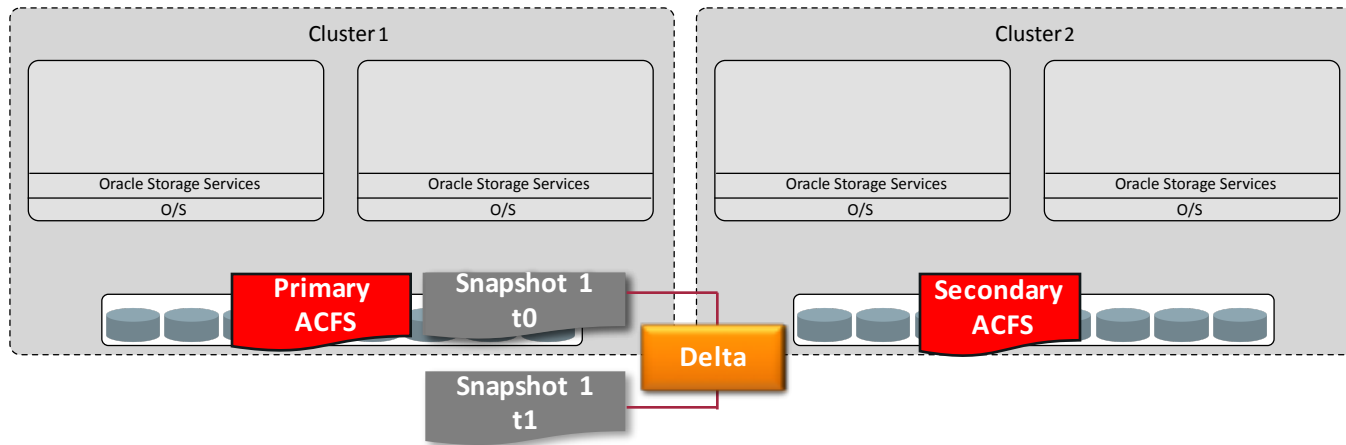

- Under load, data for DB in cluster 2 is relocated to physical storage local to cluster 2.

Business Challenges – Need for Provisioning Application Test and Development Environments

- Application environments consisting of applications and data, require point-in-time capture and movement to secondary environments for testing and development (Test/Dev).

Test/Dev Provisioning Across Clusters with ACFS Replication for Applications (Current)

- Efficient replication of ACFS file systems to a remote site.
- **Cross-OS/Server/Cluster** replication among primary and secondary site.
- Allows for snapshots on secondary site for Test/Dev.

Program Agenda

- 1 Introduction
- 2 Oracle Storage Roadmap
- 3 Business Challenges Solved
- 4 Conclusion

Conclusion

Standalone Cluster

Cluster Domain Storage

Converged Storage

NUSA Storage

- Evolution to cloud computing require new storage architectures enabling data independence from the host platform.
- **Oracle Storage** throughout its evolution, provides the foundation for **data mobility** for the Oracle Database and application data.
